Same Entropy, Different Risk

The leading predictions and Shannon entropy are identical in both cases.

A · 10% Probability in the Tail

Same leaders: PO = 0.38 · po = 0.26

H ≈ 1.83

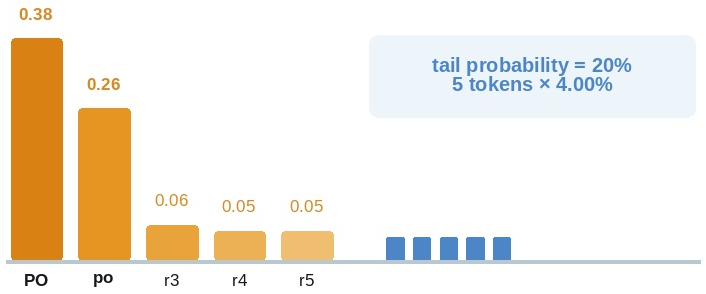

10% outside the top-5

B · 20% Probability in the Tail

Same leaders: PO = 0.38 · po = 0.26

H ≈ 1.83

20% outside the top-5 (2×)

Same entropy, different tail risk: probability outside the top-5 doubles from 10% to 20%.
